

Closest Points

Given a set of points in a two dimensional space, you will have to find the distance between the closest two points.

Input

The input file contains several sets of input. Each set of input starts with an integer N ($0 \leq N \leq 10000$), which denotes the number of points in this set. The next N line contains the coordinates of N two-dimensional points. The first of the two numbers denotes the X -coordinate and the latter denotes the Y -coordinate. The input is terminated by a set whose $N = 0$. This set should not be processed. The value of the coordinates will be less than 40000 and non-negative.

Output

For each set of input produce a single line of output containing a floating point number (with four digits after the decimal point) which denotes the distance between the closest two points. If there is no such two points in the input whose distance is less than 10000, print the line 'INFINITY'.

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Sample Input

```

3 #sets
0 0
10000 10000
20000 20000
5 #sets
0 2
6 6
43 71
39 107
189 140
0 = end

```

dist > 10000
dist > 10000
min

Sample Output

```

INFINITY dist = 10,000
36.2215

```
